

Comm One, Inc.

PBX Interface Module

Comm One® Call Accounting Pro for Windows is a powerful software tool for managing, tracking, and reducing the cost of maintaining voice and data communications. The system is flexible enough to not only track local and long distance calling, but powerful enough to perform full billing of complete communications costs to tenants, departments, individual phone users, and other users of your phone system. The system also includes powerful billing features that can be used to bill all types of communications costs including Toll Charges, Cellular Phone Costs, Pagers, Monthly Port Fees, Collect Calls, Set Charges, and many other charges that are associated with running a communications system.

PBX INTERFACE MODULE OVERVIEW

Comm One PBX Interface Module allows you to automatically link your telephone database stored in your phone system with the station database stored in Comm One Call Accounting Pro and Cable Management Pro Software. Using this optional module, you can easily import telephone station information into your Comm One Software. You can do this import when the system is first installed, as well as schedule periodic updates as you move forward. This software can save you many hours that would be required to program your Comm One Software manually. Plus the information is more accurate since it is entered only once, (in your phone system), and then transferred over into Comm One Software.

PBX FIELDS YOU CAN IMPORT

The exact fields you can import using the PBX Interface Module differs depending upon your phone system software, but the module supports the following fields. Please contact us with your phone system and software version and we can tell you the exact fields you can import from your system.

- * Extension
- * User Name
- * Phone System Port Address
- * Phone Set Type
- * Building
- * Room
- * Jack
- * Cable
- * Pair
- * Floor
- * Class of Service
- * Hunt Group
- * Pick Group
- * Authorization Code

SINGLE POINT OF ENTRY

The only thing worse than entering information once, is to have to enter the same information twice. Using Comm One's PBX Interface Module, you enter your data once -- in your phone system, and then it flows thru to Comm One Call Accounting and Cable Management. If information needs to be changed, you do it in your phone system, and it updates your Comm One Software
