COMM ONE[®] TOLL TAPE INTERFACE MODULE

Comm One Toll Tape Interface allows you to import other telecom related charges into your Comm One Call Accounting Pro so that they can all be billed together on a single bill. Charges that you can import include:

- Telephone Calling Card Charges
- 800 Toll Free Inbound Charges
- Pager Charges
- Cellular Phone Charges

TELEPHONE BILLS IN ELECTRONIC FORMAT

In order to use this module, you need to get copies of the bills that you wish to import in electronic format. For some vendors this is very easy, for others it can be a difficult task.

TELEPHONE CALLING CARD CHARGES

If you have a number of employees that use company Calling Cards to make telephone calls while they are outside the office, you understand how difficult it can be to track these charges back to the department that made them. With this module, you can associate each calling card with an employee and/or department. You can then request a copy of your bill in electronic format. Comm One's Toll Tape Interface Module can import these charges so that they show up on your monthly Call Accounting bill along with the calls that were made by each employee in the office. Because the process is automated it is more accurate, and it is usually much quicker than processing the bills and charging them back by hand.

PAGER AND CELL PHONE CHARGES

With this module, you can import both monthly and recurring charges for pagers and cell phones. This makes these charges easier to charge back to departments because they are on the same bill as the toll charges from each users telephone extension. The call detail from the cell phones can also be imported into the Call Accounting for review. Because all of each employees calls are in a single place, it makes it easier for you to track for toll-fraud, and easier to see how each employee is using or mis-using telecom resources.

UNLIMITED TOLL TAPE INPUTS

The current Toll Tape Module supports up to 6 different inputs for each extension record. For users with more than 6 inputs, you can create a second or third extension record, each with 6 different telecom inputs.
